

## RECOMMENDATION 832

## WORLD ATLAS OF GROUND CONDUCTIVITIES

(1992)

The CCIR,

*considering*

- a) that for ground-wave field strength prediction, it is essential to know the electrical characteristics of the ground along the path. In cases involving coordination between administrations, it is therefore often necessary to know the ground characteristics existing outside national boundaries;
- b) that the most important electrical characteristic of the earth for frequencies below 3 MHz is the conductivity;
- c) that there is a need for suitable conductivity charts when planning all types of radiocommunication, including navigational services, in the VLF, LF and MF bands;
- d) that conductivity maps are not yet available from all administrations,

*recommends*

- 1. that the information contained in Annex 1, which is a World Atlas of Ground Conductivities, be used to obtain the best estimate of conductivity for planning purposes;
- 2. that in presenting new or revised conductivity maps for updating the Atlas, standard values be used as indicated in Table 1.

## ANNEX 1

## World Atlas of Ground Conductivities

**1. Introduction**

This Annex gives information about the ground conductivities in various areas of the world, in the form of a World Atlas of Ground Conductivities called for in Resolution 73. This information is intended to be used for field-strength predictions in connection with the ground-wave propagation curves contained in Recommendation 368.

**2. Preparation of conductivity maps**

In its work on the World Atlas, the CCIR needs information from every administration. Conductivity maps have been presented in different ways, but in future it would be helpful if they were presented with the same standard set of values of conductivity as indicated in Recommendation 368 and as shown in Table 1.

**3. The Atlas**

The contents of the Atlas are as follows:

Figs. 1-6: VLF conductivity maps

Figs. 7-43: MF conductivity maps

TABLE 1

**Standard values and ranges of ground conductivity  
for the presentation of the maps**

Standard values (S/m)	Limiting values of the range (S/m)	
	Upper limit	Lower limit
5	7	3
$3 \times 10^{-2}$	$5.5 \times 10^{-2}$	$1.7 \times 10^{-2}$
$10^{-2}$	$1.7 \times 10^{-2}$	$5.5 \times 10^{-3}$
$3 \times 10^{-3}$	$5.5 \times 10^{-3}$	$1.7 \times 10^{-3}$
$10^{-3}$	$1.7 \times 10^{-3}$	$5.5 \times 10^{-4}$
$3 \times 10^{-4}$	$5.5 \times 10^{-4}$	$1.7 \times 10^{-4}$
$10^{-4}$	$1.7 \times 10^{-4}$	$5.5 \times 10^{-5}$
$3 \times 10^{-5}$	$5.5 \times 10^{-5}$	$1.7 \times 10^{-5}$
$10^{-5}$	$1.7 \times 10^{-5}$	$5.5 \times 10^{-6}$

**3.1** The conductivity maps for the VLF part of the spectrum (Figs. 1 to 6) give values of effective ground conductivity in mS/m and are subject to the following conditions:

- they are limited in application to frequencies up to 30 kHz,
- they contain no allowance for seasonal variations,
- they have been calculated from physiographical and geological data used to define boundaries of the land areas of given conductivity, together with actual conductivity data derived from measurements,
- they represent effective ground conductivities (the effect of terrain is included in the values),
- as it seems likely that seasonal variations will become more important with increasing frequency (as the penetration depth decreases), maps for higher frequencies may need to be presented in such a way that the annual variations are shown. However, data recorded by the Administration of India indicate that at frequencies as high as 1 MHz seasonal variations in the tropics have a negligible influence on propagation.

**3.2** The maps for MF, Figs. 7 to 42 and Table 2, give the effective ground conductivities in mS/m. (The maps are standardized to 1 MHz.) These maps are based on measurements and other relevant information provided by the various countries. They contain no allowance for seasonal variations.

**3.3** For those areas for which results of conductivity measurements are not available, provisional information for MF use is shown in Fig. 43. It is expected that this information will be superseded by later editions of the World Atlas to be published by the ITU.

**3.4** The conductivities on the MF maps are shown as presented by administrations. For those countries not represented in the Atlas, no information has been made available.

#### **4. Future revision of the Atlas**

**4.1** Administrations are asked to check and, if necessary, revise the information given in this Atlas.

**4.2** Administrations are asked to adjust areas of given conductivity so that each conductivity is one of the standard values given in Table 1.

**4.3** It is recognized that because of the use of different methods for measuring ground conductivity, discontinuities will occur at the borders between countries. However, administrations are requested to resolve these problems bilaterally.
